

HW-4:

P . 117::

11-

- (i) True, let  $y=1-x$ . Then the inequality holds.
- (ii) True, let  $y=x-1$ . Then the inequality holds.
- (iii) False, because for each  $x$ , we can have  $y=-x-1$ , which results in  $x+y=-1<0$ .
- (iv) False, for  $x=0$  there does not exist such  $y$ .
- (v) For each  $x$ , let  $y=-x$ , then  $xy=-x^2<0$ .
- (vi) True. Let  $y$  be always 0!
- (vii) True, the statement holds for  $x=0$ .
- (viii) True, let  $y=-x$ , then we have  $y+x=0$ .
- (ix) False, since a number cannot be both greater and equal zero.
- (x) True, as both statements are true statements.

12-

Let  $A=\{1,2,3\}$ . Obviously, it is a subset of integers, and has 3 as the greatest number.

Also let  $A=\{1,3,5,7,\dots\}$ , that does not have any largest element!

$$\exists N \in A \subseteq \mathbb{Z} : y \in A \Rightarrow y \leq N$$

13-

$$A \times (B \cup C) = \{(x, y) | x \in A \text{ and } ((y \in B) \text{ or } (y \in C))\}$$

$$(A \times B) \cup (A \times C) = \{(x, y) | ((x \in A) \text{ and } (y \in B)) \text{ OR } ((x \in A) \text{ and } (y \in C))\}$$

By expanding the statement within  $\{\dots\}$ , that is using  $(p \wedge q) \vee (p \wedge r) = p \wedge (r \vee q)$  we find out that the two sets are equal.

(ii)

$$(A \times B) \cap (C \times D) = \{(x, y) | ((x \in A) \text{ and } (y \in B)) \text{ AND } ((x \in C) \text{ and } (y \in D))\}$$

But as  $(p \wedge q) \wedge (r \wedge s) = (p \wedge r) \wedge (q \wedge s)$  we have

$$(A \times B) \cap (C \times D) = \{(x, y) | ((x \in A) \text{ and } (x \in C)) \text{ AND } ((y \in B) \text{ and } (y \in D))\}$$

Which is exactly  $(A \cap C) \times (B \cap D)$ .

$$15\text{-}(i) \chi_A(x)\chi_B(x) = 1 \Leftrightarrow (\chi_A(x) = 1 \text{ and } \chi_B(x) = 1) \Leftrightarrow (x \in A \text{ and } x \in B) \Leftrightarrow x \in A \cap B$$

$$\begin{aligned} \chi_A(x)\chi_B(x) = 0 &\Leftrightarrow (\chi_A(x) = 0 \text{ or } \chi_B(x) = 0) \Leftrightarrow (x \notin A \text{ or } x \notin B) \Leftrightarrow \sim(x \in A \text{ and } x \in B) \\ &\Leftrightarrow \sim(x \in A \cap B) \Leftrightarrow x \notin A \cap B \end{aligned}$$

We made use of the facts that 1) Chi can be either 0 or 1, 2) the product of two real numbers is zero iff at least one of them is zero.

(ii)

By an easy computation we find out that:

	$\chi_A$	$\chi_B$	$\chi_C$	$\chi_{A \cup B}$
$x \in A \wedge x \in B$	1	1	1	1
$x \in A \wedge x \notin B$	1	0	1	1
$x \notin A \wedge x \in B$	0	1	1	1
$x \notin A \wedge x \notin B$	0	0	0	0
